partner for the astronomy
facilities in Chile**

Current status of the backbone

April/19th Launching of 1st 100G DWDM optical path: La Serena - Santiago

LATERCERA

Este jueves se inauguró primer tramo de 800 km, que une Coquimbo con Santiago.

Lighting up the LSST Fiber Optic Network: From Summit to Base to Archive

- Transfer data from Pachon/LSST to NCSA Illinois USA.
 - A set of 6 x 10 Gbps network interface cards in data transfer nodes (DTN) using iPerf3 software generated a sustained data rate of 48Gbps for 24-hour period. This exceeded the test objective of 40 gigabits per second.

Santiago – Concepcion - Temuco

- 800Km fiber
- In partnership with a Telco Company
- Technical challenge
- 13 add&drop nodes
- Will use two DWDM solution
 - CORIANT
 - PADTEC (lambda alien)
- Status:
- All the equipment installed
- This week is being doing the last step the equalization of the lambdas
- Benefit:
- One 10G dedicated cannel for each Institution in REUNA along the path

A Pilot communication test
in collaboration with Simons
Observatory and ALMA
REUNA's PoP in Chajnantor
demo

Chajnantor Working Group meeting 9-10/May/2018 OSF ALMA facilities

Atacama Large Millimeter/submillimeter Array

REUNA PoP@ALMA-AOS

ALMA is working closely with REUNA for the creation of a Point of Presence (PoP) at the ALMA AOS Technical Building, so that REUNA could be able to provide general communication services once a project has connectivity to the ALMA Technical Building.

As part of this effort, an end-to-end simulation has been done in collaboration with the Simons Observatory that demonstrated the feasibility of the concept (see previous presentation).

Building on this, ALMA will start progressing in the formalization of an agreement with REUNA.

Alternatively, a non-ALMA project can choose to connect with other provider.

Source: Jorge Ibsen, presentation CWG 2018

The goal of the experiment

**To simulate a connection PoP at AOS
to bring connectivity to others
Observatory using part of the existing
network infrastructure**

Network infrastructure

- AOS – Calama: Fiber, transporting 1x10Gbps today
- Calama – Antofagasta: 10Gbps
- Antofagasta-La Serena: 10Gbps
- La Serena – Santiago: 2x10Gbps*

Use of the 10G Antofagasta – Santiago:
2G ESO, 4G REUNA & RedCLARA, 2G ALMA

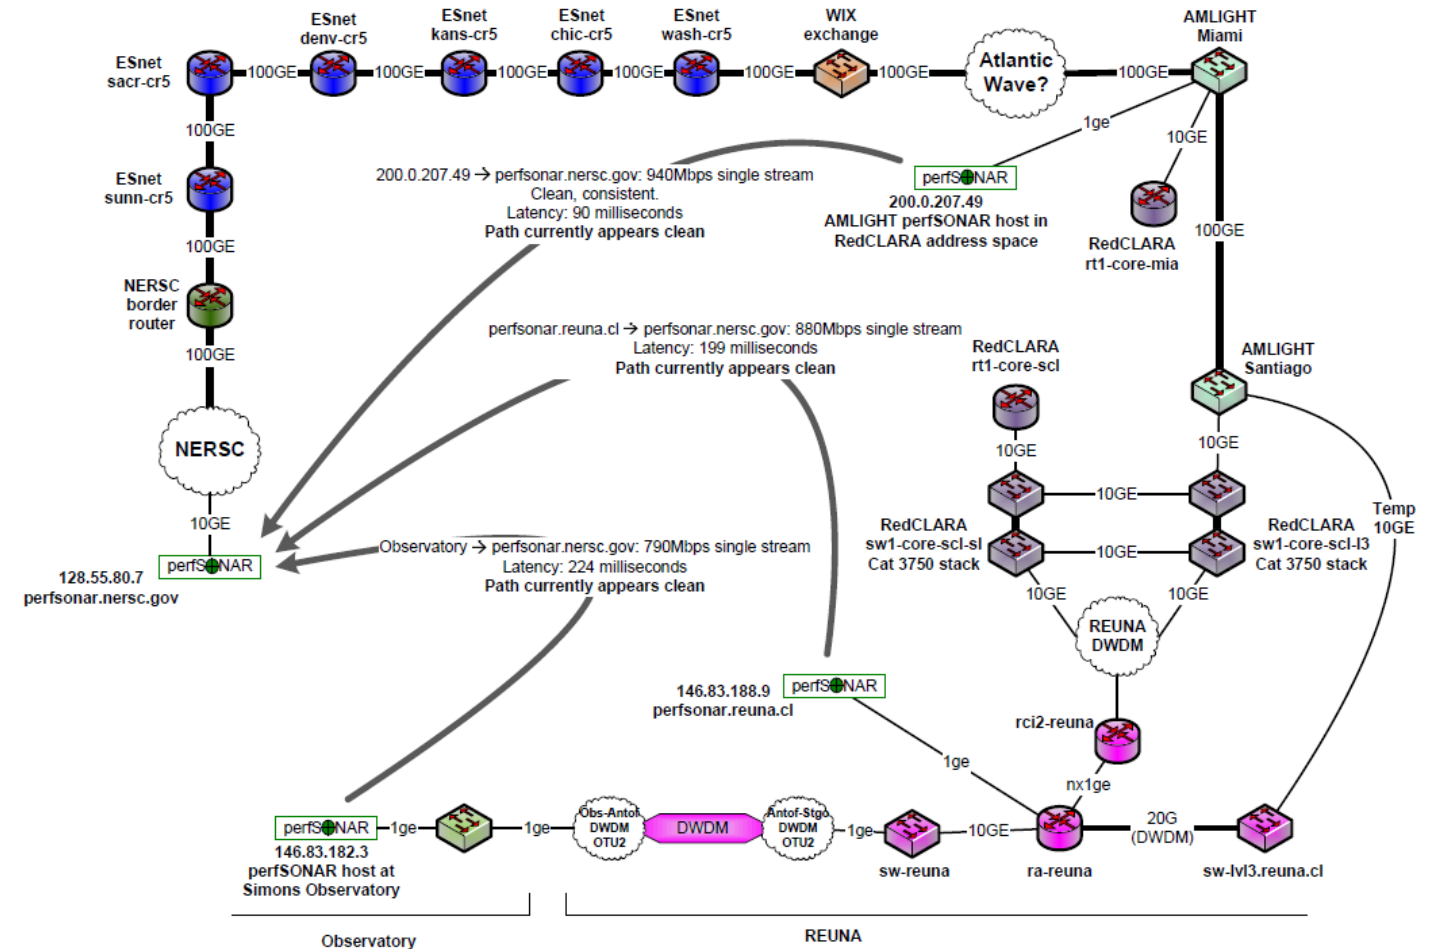

The resources used for the experiment

- Temporary Access provided by ALMA:
 - PC with LINUX and a Cisco Switch
 - AOS – Calama: 1Gbps over 1x10G on fiber
 - Calama – Antofagasta: 1Gbps over 1x10G
- Temporary Access provided by REUNA:
 - Antofagasta-La Serena: 1Gbps over 1x10G
 - La Serena – Santiago: 1Gbps over 2x10G
 - Santiago-Miami: 1G best effort over 10G (*)
 - Miami-NERSC: Best effort over Internet2 + ESNET 100G network (*)
 - Public IPv4/24 network segment

(*) Temporary access in collaboration with RedCLARA, ESNET

Thanks to Eli Dart from ESNET for
prepare the map and join all the
topology information

Work in Progress

Some results

| # Source | Destination | Bw (Mbps) | latency |
|------------------|------------------|-----------|---------|
| 1 AOS/Simons | REUNA Santiago | 900 - 900 | 24.5 |
| 2 REUNA Santiago | RedCLARA Miami | 300 - 250 | 107 |
| 3 RedCLARA Miami | NERSC California | 900 - 900 | n/a |
| 4 AOS/Simons | NERSC California | 400 - 90 | 196 |
| 4 AOS/Simons | NERSC California | 600/500 | n/a |

*: Preliminary results

After isolated a switch with problems in Level3

- Successful implementation: 1Gbps transport from AOS to Santiago with full connectivity services
- Bandwidth: full link capacity from AOS to Santiago (1Gbps), international range in the order of 600Mbps
- Very good example of “networking” collaboration (Simons Obs, ALMA, REUNA, RedCLARA, Amlight, ESNET,)

The future

- 2018:
 - La Serena – Temuco: 100G DWDM network
- 2019
 - La Serena – Antofagasta
 - Antofagasta – Calama
 - Calama – Arica
- 2020
 - Temuco – Puerto Montt
- 2021
 - Potential integration with FOA
