

CI Engineering Brown Bag / Oct 18th, 2019

AmLight-INT: In-band Network Telemetry to support big data applications

Jeronimo Bezerra - IT Associate Director/FIU

Arturo Quintana - Sr. Software Developer/FIU

Outline

- Network Monitoring: Current Limitations and Technologies
- Introduction to Network Telemetry
- Current Network Telemetry Efforts
- Telemetry at AmLight: A Use Case
- Next Steps

Warming Up!

All networkers in the call have heard at least one of these questions from users:

- *Why am I not getting full bandwidth for my download?*
- *Why is my application achieving such a poor network performance?*
- *Where is the packet loss?*
- *May I be placed outside of the firewall?*

Current Network Monitoring Limitations and Technologies

- Answering questions about network visibility and performance and isolating faults affecting data transfers are still highly complex
 - **Hardly answered in real-time.**
- Example of questions network operators ask themselves that usually have incomplete answers:
 - *“Where is the 1:1,000,000 packet loss?”*
 - *“Are there [micro] bursts happening now?”*
 - *“Which network queues are running at their maximum capacity?”*
 - *“Which flows were using the network queues when network queues were full?”*

Current Network Monitoring Limitations and Technologies [2]

- Complexity exists because we are still leveraging legacy tools
 - Traceroute, ICMP, SNMP, NetFlow, RMON, and sFlow.
 - Such tools can collect statistics based on samples or on-demand tests.
 - Port-mirror and network taps operate out-of-band and provide good visibility but impose huge challenges for scalability in a multiple connections scenario.
- New protocols, such as OpenFlow and Ethernet OAM, do not capture transient events, such as a microburst, nor do they enable network operators to find the root cause of many network anomalies.

Current Network Monitoring Limitations and Technologies [3]

- To add complexity, new *real-time* big-data applications are being created with very strict Service Level Agreements (SLA).
- Any attempt to track network state in *real-time* could become a very complex and expensive task.
 - Polling SNMP or OpenFlow counters is not recommended in a sub-30s interval.
 - Sampling technologies usually export data after a few seconds.
 - Packet sniffing at 100G has a high CAPEX and OPEX.
- Identifying microburst or isolating packet loss in *real time* is not trivial with current technology.

Introduction to Telemetry

- *Telemetry* is a very popular concept in the *medical* and *geology* environments.
- Medical telemetry refers to the machines that patients are hooked up to when they are at risk and need to be continuously monitored.
- There are many important **metrics**:
 - Examples: cardiac rhythms, blood pressure, and blood oxygen levels.
- Important **properties**:
 - Accuracy, utility of each metric that is measured, granularity, sample rate, and alerts in case of a problem.
- **Real time detection and notification is required.**

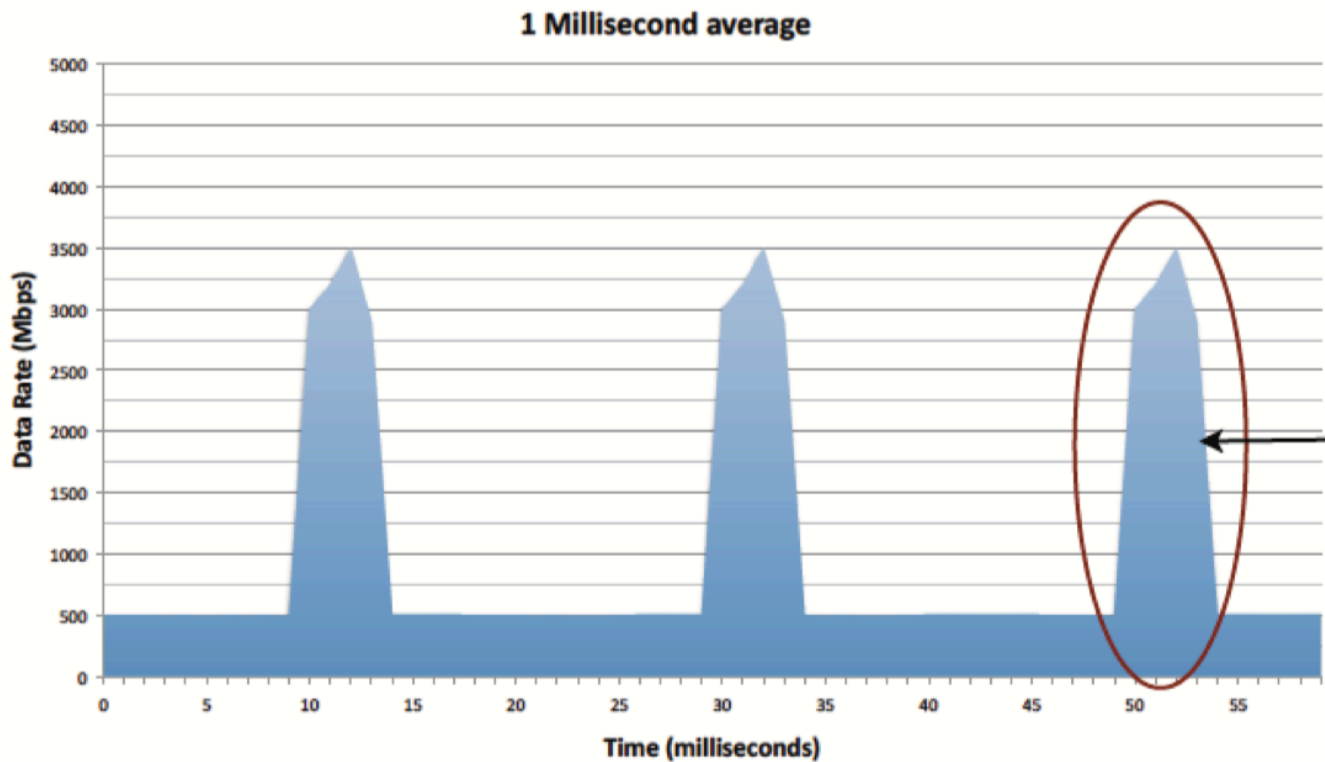

Introduction to *Network Telemetry*

- Network telemetry is the *extension* of network reporting to *higher granularities* and sample rates combined with *actionable metrics and alerting* [1]
- Network telemetry technologies define several characteristics [2]:
 - Push and Streaming: Instead of polling data from network devices, the telemetry collector subscribes to the streaming data pushed from data sources in network devices.
 - The data is normalized and encoded efficiently for export.
 - The data is model-based which allows applications to configure and consume data with ease.
 - Network telemetry means to be used in a closed control loop for network automation
 - Also known as *streaming network telemetry* or *streaming telemetry*
- Streaming network telemetry is very useful to detect microburst and queue utilization at a sub-second interval
- With all historic network state, forensic troubleshooting is enabled

New Telemetry Trends @ IETF and ONF

- In 2016, P4.org group create a new P4 application:
 - In-band Network Telemetry (2016)
- IETF Internet Protocol Performance Measurement (ippm) WG:
 - Proof of Transit (2016)
 - Encapsulations for In-situ OAM Data (2017)
 - Data Fields for In-situ OAM (2017)
 - Requirements for In-situ OAM (2018)
- IOAM, In-situ OAM, In-band OAM, INT, In-band Network Telemetry are used interchangeably in *this* presentation.

In-band Network Telemetry (INT)

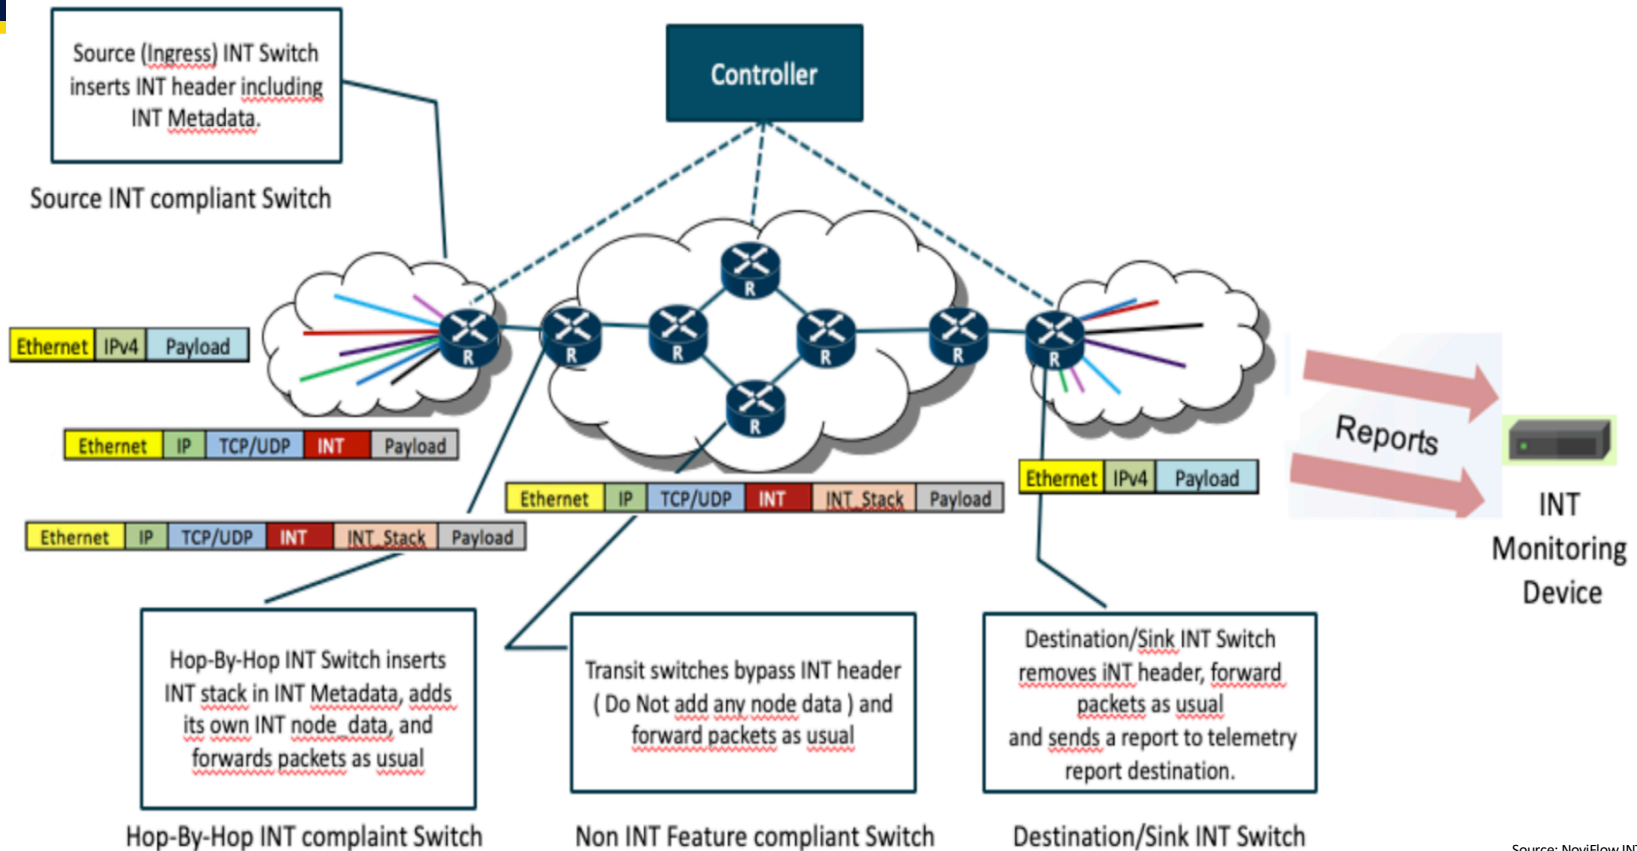

- INT is an implementation to record operational information in the packet while the packet traverses a path between two points in the network:
 - Complements current out-of-band OAM mechanisms based on ICMP or other types of probe packets.
 - Basically, INT adds metadata to each packet with information that could be used later for troubleshooting activities.
- Example of information added:
 - Timestamp, ingress port, egress port, pipeline used, queue buffer utilization, WiFi link power, CPU utilization, Battery Utilization, Sequence #, and many others
- As metadata is exported **directly from the Data Plane**, Control Plane is not affected:
 - Translating: *you can track/monitor/evaluate **EVERY** single packet at line rate.*

Questions addressed by INT

- *How did this packet get here?*
 - The sequence of network devices a packet visited along its path.
 - LAG? No problem. ECMP? No problem. Layer 2 network? No problem!
- *Why is this packet here?*
 - The set of rules a packet matched upon at every switch along the way.
- *How long was this packet delayed?*
 - The time a packet spent buffered in every switch, to the nanosecond, from end-to-end.
- *Why was this packet delayed?*
 - The flows and applications that a packet shared *each queue with*.

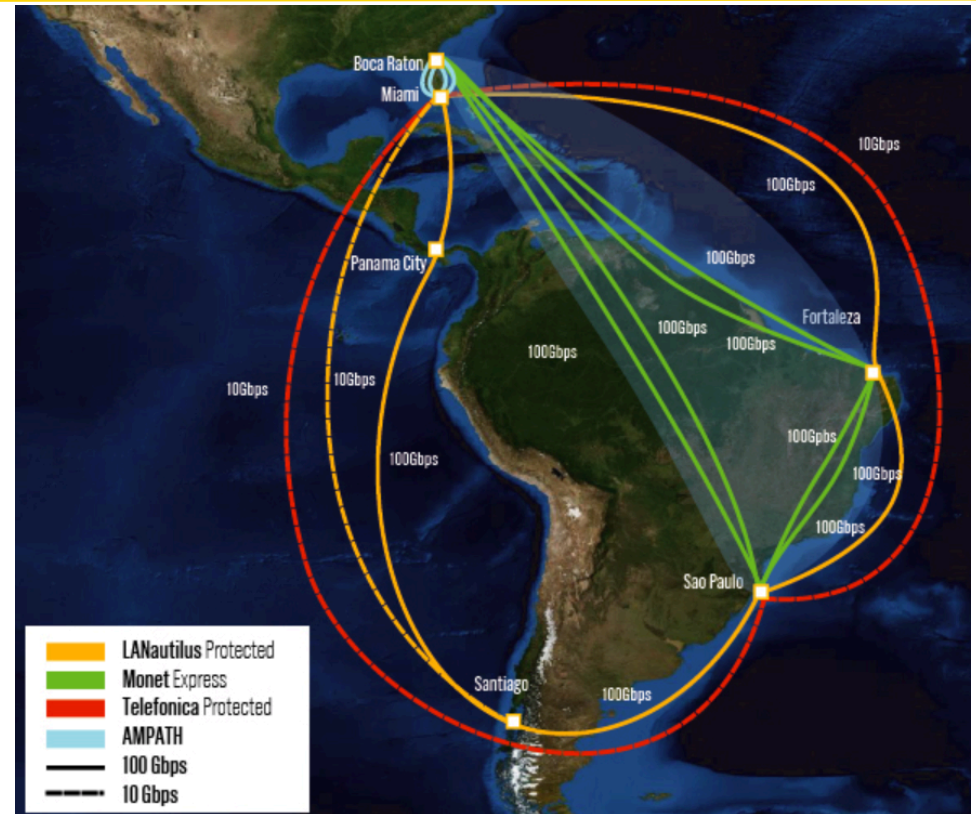

INT: How does it work?

Source: NoviFlow INT Setup Guide

Introduction to AmLight

- AmLight Express and Protect (AmLight-ExP) (NSF International Research Network Connections (IRNC) Award #1451018)
- 680Gbps of upstream capacity between the U.S. and Latin America
- Production SDN Infrastructure since 2014
- NAPs: Florida(2), Brazil(2), Chile, Puerto Rico, and Panama
- Carries Academic and Commercial traffic
- Control Plane: OpenFlow 1.0 and 1.3
- Inter-domain Provisioning with NSI
- A consortium involving FIU, NSF, RNP, ANSP, CLARA, REUNA, and AURA.

Telemetry at AmLight: LSST Use Case

- Supporting the Large Synoptic Survey Telescope (LSST)'s requirements
 - The LSST will be installed in Chile
 - **Every 27 seconds** throughout the night, the telescope will take a 6.4GB picture of the sky, process it, generate transient alerts (6.3GB) from this picture, and send the 12.7GB data-set to Illinois/USA
 - **From the 27-seconds window, only 5 seconds are available for data transmission**
 - Multi traffic types with different priorities (db sync, control, general internet traffic)

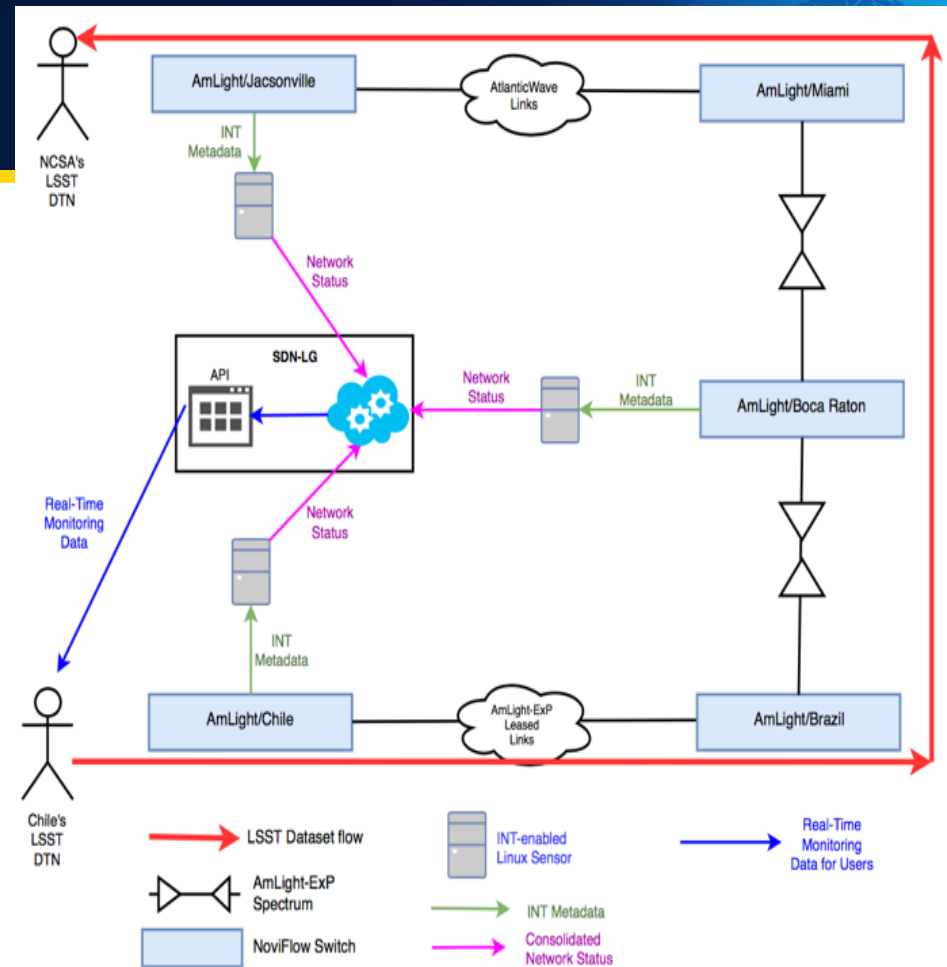

Telemetry at AmLight: LSST Use Case [2]

- What if the LSST doesn't manage to send its data in its 5-seconds transfer window?
 - For instance, because of packet loss, lack of capacity, lack of buffers, microburst, DoS attacks?
- If the data transfer window is missed, will AmLight engineering team be able to fix whatever it is happening before the next data transfer window (in less than 22 seconds)?
- How many windows are we going to miss if we have to troubleshoot it manually?

■ *AmLight-INT Project might be the solution!*

AmLight-INT Project

- NSF IRNC: Backbone: AmLight In-band Network Telemetry (AmLight-INT), Award# OAC-1848746
 - Started in Nov 2018
- AmLight-INT Project Plan:
 - Deploy P4/INT-capable switches
 - Deploy INT Collectors (100G hosts) to collect metadata
 - Develop a new methodology to collect and export INT data in real time to feed SDN controllers and users with monitoring information
 - Create a Network Telemetry Design Pattern to be used by other R&E networks

Research challenges being addressed

- *How many high-priority flows can be handled in real-time by the INT Collector?*
- *What is the impact caused by INT in a complex network such as AmLight-Exp (increasing MTU, extra delay)?*
- *How to dynamically enable INT monitoring of specific flows?*
- *What is the definition of real-time for AmLight and LSST?*
- *How to store and process multiple Gbps of telemetry data per switch?*
- *How to share the network state with the users?*

AmLight-INT Project

- Collaboration between **FIU** and **NoviFlow** to expand AmLight SDN network towards an INT-capable domain
- Characteristics of the NoviFlow WB5132 switches @ AmLight:
 - Barefoot Tofino chip:
 - Provides a software-based SDN evolution path to P4-Runtime
 - 32 x 100G (high throughput: 3.2 Tbps)
 - NoviWare supports OpenFlow 1.3 (also 1.4 and 1.5) with BFD and LAG
- NoviFlow has already released five NOS versions to enable INT
 - P4/INT specification being followed
 - Nothing is proprietary or strictly created to support the LSST project

First Results (June)

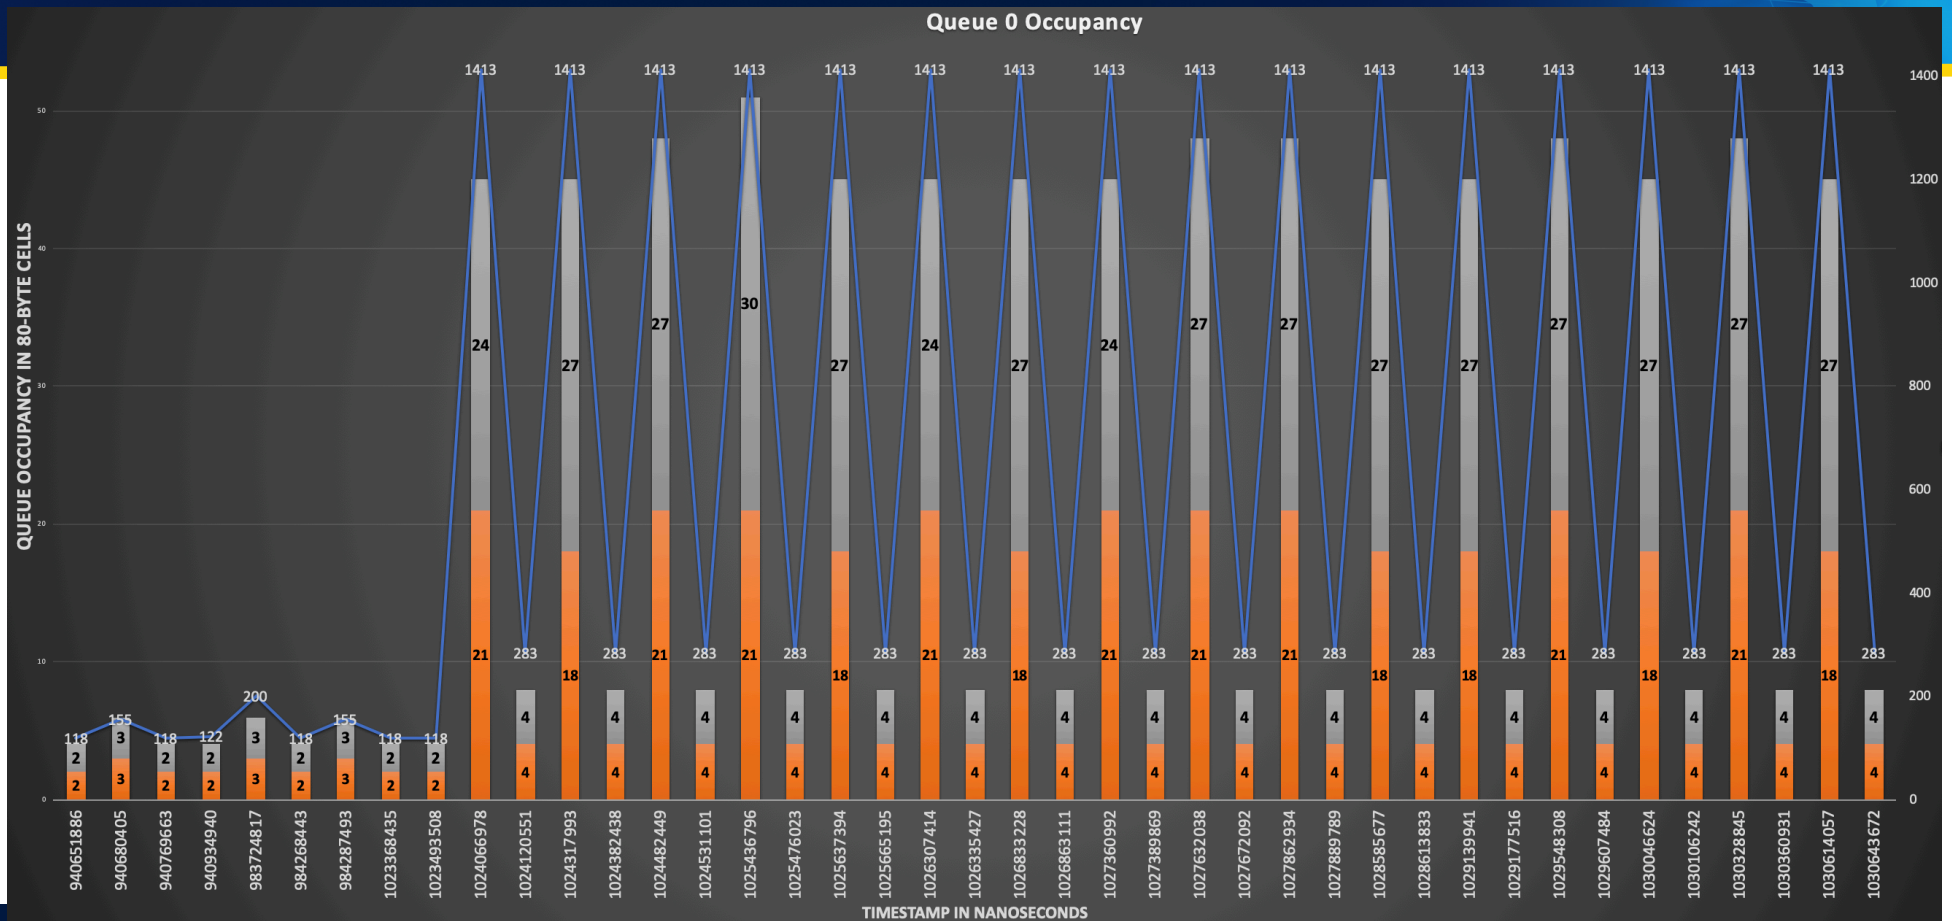

- Wireshark Dissector created by NoviFlow (figure)
- AmLight-INT Collector v0.1:
 - Developed using Python 3.7
 - Receives Telemetry Reports from switches
 - Parses and sends to a RabbitMQ queue to be consumed
 - Saves Telemetry Reports to disk

First Results – Queue 0's Jitter

First Results – Queue 0's Occupancy

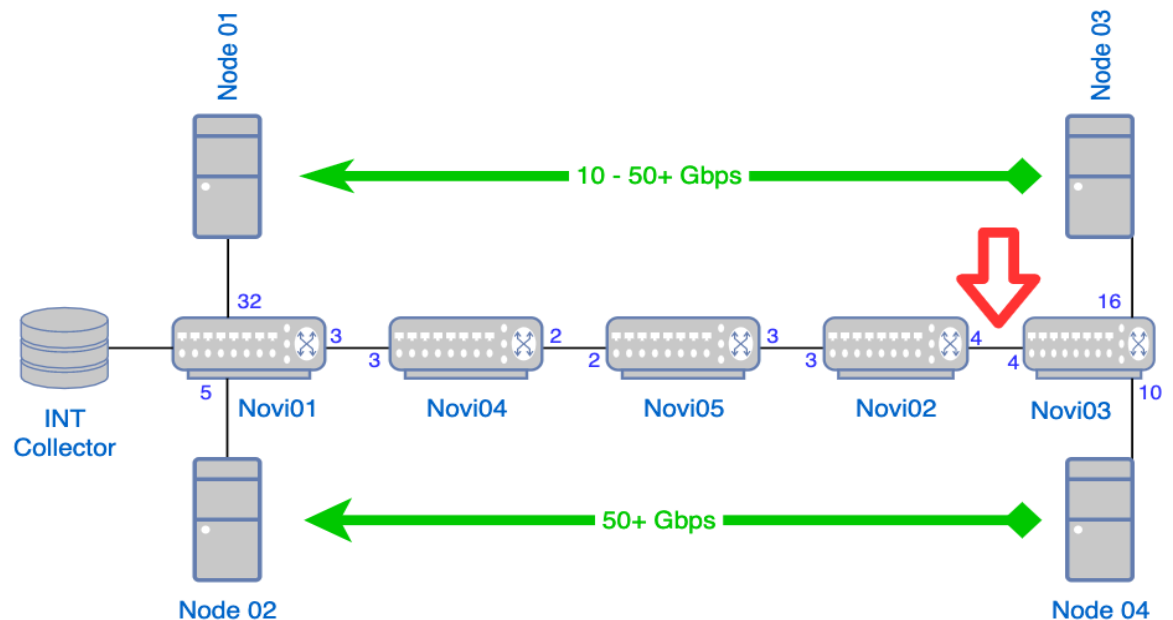

Network Telemetry @ AmLight // CI Engineering Brown Bag – Oct 18th, 2019

23

Last Results (October)

- AmLight-INT Collector's QueueTop application consumes INT data and display realtime monitoring of the network's queues
- Topology on the right created to enable experimentation
 - All links and devices are 100G
 - Novi03 switch port 04 has a bottleneck: Node 03 and Node 04 are sending data to their peers.
 - Let's see what happens next...

One Source - One Destination - TCP - ~60Gbps

- Node 04 sending data using TCP to Node 02 at ~50Gbps
- No other traffic
- Top:
 - All Queues are using 114-115 cells (or 9K bytes)
- Bottom:
 - Hop Delay around 1 microsecond (except for Novi03 that ADDs INT header)

```
QueueTop 0.1 || Stats: Devices: 5 Interfaces: 5 Queues: 5 Reports: 12975 MTU Issues: 0
List of Devices, Interfaces, Queues, and Queue Occupancy:
-----
Novi01      32 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 115 Cells]
Novi04       3 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 115 Cells]
Novi05       2 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 115 Cells]
Novi02       3 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 114 Cells]
Novi03       4 2 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 114 Cells]
```

```
QueueTop 0.1 || Stats: Devices: 5 Interfaces: 5 Queues: 5 Reports: 838 MTU Issues: 0
List of Devices, Interfaces, Queues, and Queue Occupancy:
-----
Novi01      32 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 899 ns]
Novi04       3 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 1014 ns]
Novi05       2 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 905 ns]
Novi02       3 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 1012 ns]
Novi03       4 2 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 2177 ns]
```

Two Sources - Two Destinations - TCP - ~80Gbps

- Node 04 sending data using TCP to Node 02 at ~50Gbps
 - Node 03 sending data using TCP to Node 01 at ~25Gbps
 - Shared interface/queue on Novi03 port 4
-
- Top:
 - Now Novi03 uses 1026 cells
 - Bottom:
 - Hop Delay at Nov03 around 9 microseconds (add_int_metadata and queueing)

```
QueueTop 0.1 || Stats: Devices: 5 Interfaces: 5 Queues: 5 Reports: 14381 MTU Issues: 0
List of Devices, Interfaces, Queues, and Queue Occupancy:
-----
Novi01      32 0 [|||||] 115 Cells]
Novi04       3 0 [|||||] 115 Cells]
Novi05       2 0 [|||||] 115 Cells]
Novi02       3 0 [|||||] 114 Cells]
Novi03       4 0 [|||||] 1026 Cells]
```

← Hop
Queue
Occupancy
increasing
9x

```
QueueTop 0.1 || Stats: Devices: 5 Interfaces: 5 Queues: 5 Reports: 29859 MTU Issues: 0
List of Devices, Interfaces, Queues, and Queue Occupancy:
-----
Novi01      32 0 [|||||] 941 ns]
Novi04       3 0 [|||||] 1100 ns]
Novi05       2 0 [|||||] 912 ns]
Novi02       3 0 [|||||] 1088 ns]
Novi03       4 0 [|||||] 9358 ns]
```

Hop Delay
increasing
4x →

Two Sources - Two Destinations - TCP – 100% output utilization

- Node 04 trying to send as much data using TCP as possible to Node 02
- Node 03 trying to send as much data using TCP as possible to Node 01
- Shared interface/queue on Novi03 port 4
- Top:
 - Now Novi03 uses **3306** cells (or 264KB)
- Bottom:
 - Hop Delay at Nov03 around **28** microseconds (add_int_metadata and queueing)

Question: What has happened to Novi01 and Novi04 queues???? Under investigation.

```
QueueTop 0.1 || Stats: Devices: 5 Interfaces: 5 Queues: 5 Reports: 82485 MTU Issues: 0
List of Devices, Interfaces, Queues, and Queue Occupancy:
-----
Novi01      32 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 24035 Cells
Novi04       3 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 24035 Cells
Novi05       2 0 [||||||||| 125 Cells]
Novi02       3 0 [||||||||| 135 Cells]
Novi03       4 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 3306 Cells]
```

```
QueueTop 0.1 || Stats: Devices: 5 Interfaces: 5 Queues: 5 Reports: 93550 MTU Issues: 0
List of Devices, Interfaces, Queues, and Queue Occupancy:
-----
Novi01      32 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 154317 ns]
Novi04       3 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 119966 ns]
Novi05       2 0 [||||||||| 1170 ns]
Novi02       3 0 [||||||||| 1384 ns]
Novi03       4 0 [||||||||||||||||||||||||||||||||||||||||||||||||||||||||| 28571 ns]
```

Next Steps

- Understanding the behavior seen so far:
 - With the current tools, we will test our theories.
- Improve INT Collector's performance:
 - Currently, a 99Gbps flow with 9000 Bytes packets generates around 5 Gbps of telemetry.
 - Using Metronome P4 NICs at the INT Collectors
- Next tools:
 - Integration with InfluxDB and Elastic for network visualization/historical data.
 - All tools will be available as Open Source code through the AmLight Github account soon:
 - <http://github.com/amlight>.
- Presentation:
 - December 10th 4:10PM at the 2019 Internet2 Technology Exchange.

The Team

- FIU team:

- Arturo Quintana – Sr. Software Developer
- Julio Ibarra – PI
- Jeronimo Bezerra – Senior Personal

- University of Passo Fundo, Brazil:

- Use of P4 Metronome NICs at AmLight
- Alisson Borges Zanetti – MSc. student
- Pedro Eduardo Camera – MSc. student
- Prof. Dr. Ricardo de Oliveira Schmidt (UPF)
- Prof. Dr. Marco Antônio Sandini Trentin (UPF)

- Kytos E-Line integration

- Kytos developers at State University of Sao Paulo/SPRACE and Academic Network of Sao Paulo/ANSP
 - Beraldo Leal, Antonio Francisco, Humberto Diógenes, Rogerio Motitsuki, and others
