

# Experiences in designing and operating an automated CI/CD pipeline for the AmLight SDN orchestrator

Italo Valcy da Silva Brito <[italo@amlight.net](mailto:italo@amlight.net)>

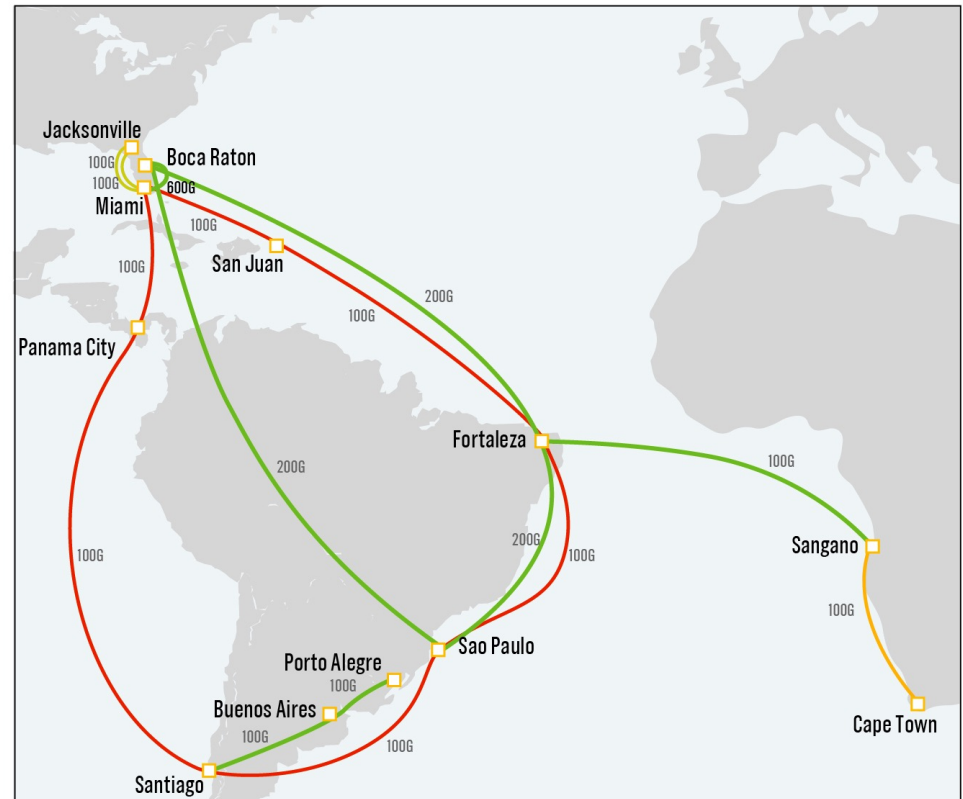

Miami, FL, US

June 21<sup>st</sup>, 2021

# Context: AmLight-ExP 2021 Network Topology

*tnc21*

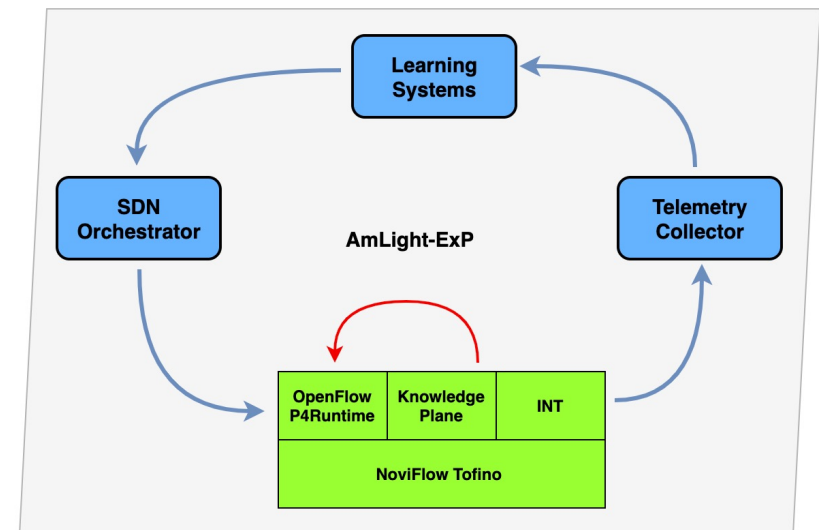

- AmLight-ExP network, +600Gbps
- Open Exchange Points: Miami, Fortaleza, Sao Paulo, Santiago, Cape Town
- Flexible SDN infrastructure since 2014
  - Programmable control-plane
  - Slicing
  - L2VPN services
  - In-band Network Telemetry
  - Pursuing programmable data-plane

# SDN Orchestrator

*tnc21*

- Major Goal: Improving Resiliency, Increasing Flexibility and Self-Management
  - SDN Orchestrator plays an important role
- Providing a Closed-Loop Orchestration
- Developing and Deploying a new SDN orchestrator to operate AmLight network:
  - User requirements not easily supported by “commodity” NOS and SDN Controllers
  - Pathfinding application handling unusual metrics (reliability, ownership, max delay)
  - Granular network telemetry per flows, per protocols, etc
  - Increased capacity to innovate
  - **Critical infrastructure**

- The AmLight SDN Orchestrator is being built over the Kytos-ng SDN Platform.
  - <https://kytos.io>
  - <https://kytos-ng.github.io>
- Features are implemented through Kytos Napps (Network applications) - <https://napps.kytos.io>
  - Based on the concept of micro-services
- Kytos-ng SDN Platform is possible thanks to the support provided by Rednesp (Research and Education Network of Sao Paulo), AMPATH/AmLight team, and by the Kytos open source community.

## Problem statement

*tnc21*

- How do we continuously update/deploy the SDN Orchestrator, providing an agile service delivery model for the users and operators in a integrated, secure, reliable and seamless manner?

## Problem statement

*tnc21*

- How do we continuously update/deploy the SDN Orchestrator, providing an agile service delivery model for the users and operators in a integrated, secure, reliable and seamless manner?
- Can we benefit from a *continuously delivery pipeline*?

# What is a continuously delivery pipeline?

*tnc21*

- Continuous Integration / Continuous Delivery (Deployment)
- Agile product delivery (software, infrastructure and network) leveraging automation as much as possible
- Aligned with DevOps culture and best practices
- Build, Test and Deploy
- Pipeline as code

# Example of an infrastructure/network pipeline

*tnc21*

Configure BGP routing policies via Ansible

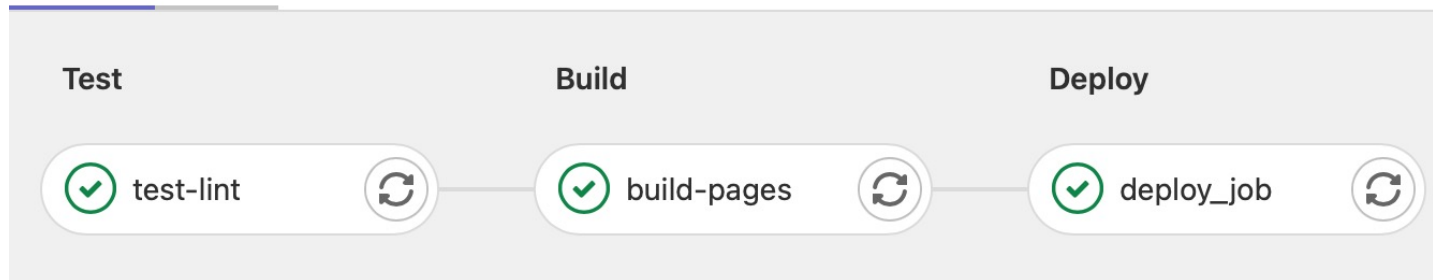

- Convert the BGP policies from a “descriptive language” to a target-specific configuration language
- Unit tests (correctness validation of the changed policy)
- Provisioning of the test infrastructure (e.g., virtual lab)
- Integration tests (network prefixes affected, overlap with other policies, traffic impact)
- Acceptance tests (how effective is the policy)
- Deploy in production (apply the config in the router)
  - Not necessarily automated

# Another example

## Logcheck - Tools for reporting unknown log events

Logcheck is a tool that analyze the log events of servers and any other equipment in by e-mail everything that is "new" (a strategy called Novelty Detection). Since most operators does not have time to keep monitoring the log files to detect problems, this is very useful because it only send the unknown events by e-mail. Being an unknown, new event means that there is no regular expression previews configured on logcheck to identify the event. AmLight uses logcheck to keep track of unknown events and take action before become a problem.

The operational guide helps the network operator in creating and testing regex configurations by logcheck.

### Creating a rule to ignore log events

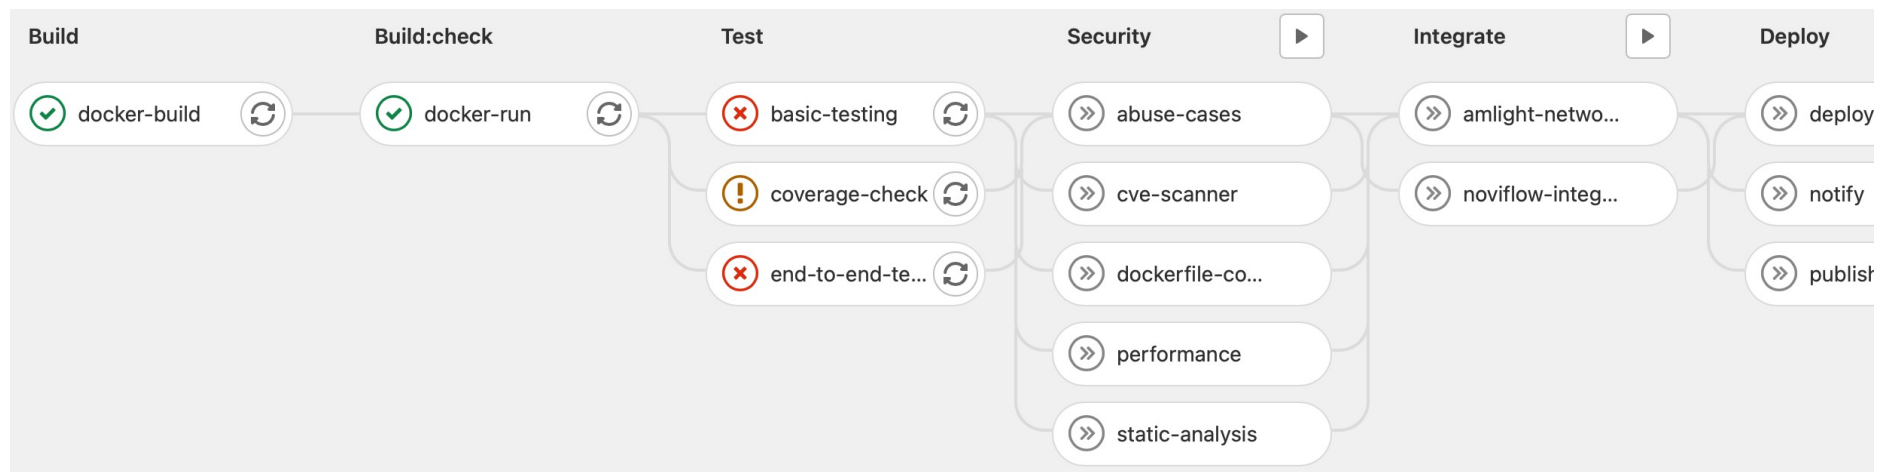

# Goals for the Kytos-ng CI/CD pipeline

*tnc21*

- Agility
  - Be able to quickly test new Kytos-ng napps (network applications) which add key services or features for our customers (e.g., INT, L3VPN, Security DPI, Threat Containment, etc)
  - Be able to evaluate the impact of changes in existing features (changes in services' APIs, changes affecting the data plane, changes affecting the control plane)
  - Be able to quickly identify bugs/mistakes and help fixing them
- Security
  - As a critical software (the network orchestrator), the more validations the better
  - Resiliency and availability must be guaranteed
  - Minimize the introduction of new security bugs
  - Contribute to the vulnerability management process

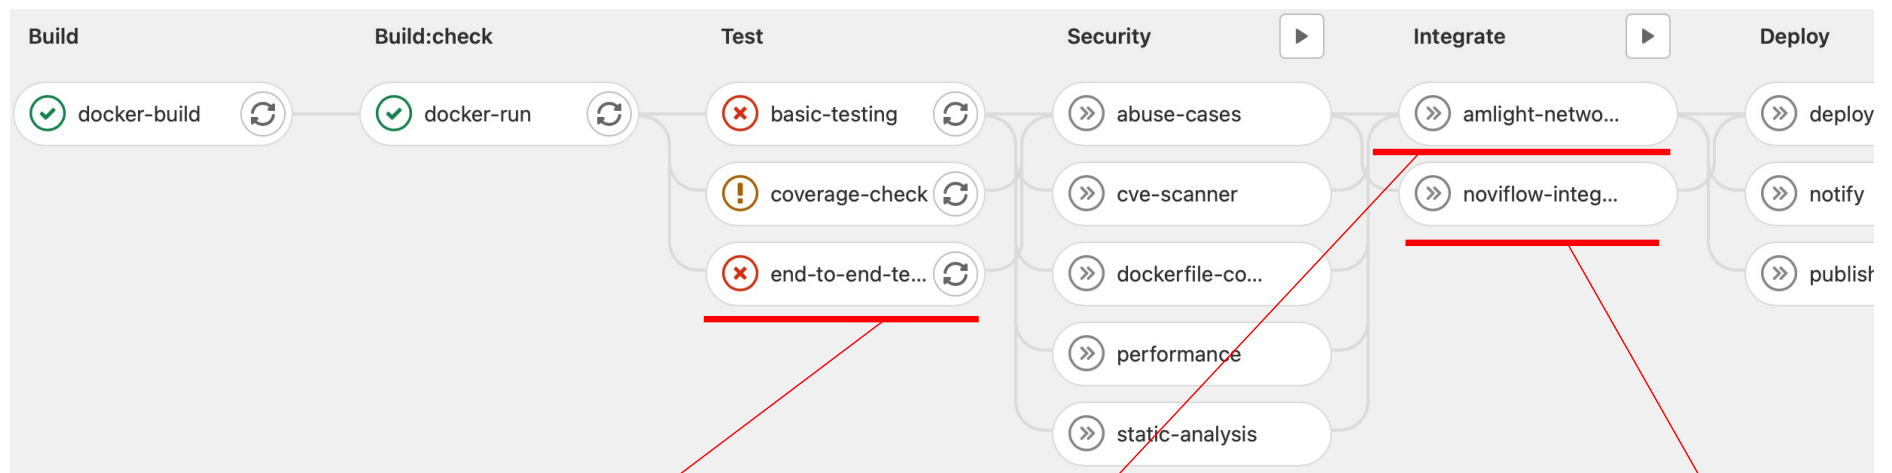

# Pipeline design

*tnc21*

# Pipeline design

*tnc21*

End-to-end tests: validate if the main services are working properly (Network emulator)

Virtual scenario/emulator using the same NOS in production, same topology, same user services

Hardware test: integration test with the same hardware (pre-production)

# End-to-end tests

The logo for TNC21, featuring the text "tnc21" in a white, italicized, sans-serif font. The background of the logo is a dark blue header bar with a colorful, abstract pattern of vertical bars in shades of purple, blue, and green on the right side.

- Goal: validate the features taking into consideration the full work-flow from the user perspective:
  - User authentication
  - Submit a user request
  - Service provisioning
  - Service operation
  - Persistency
  - Consistency
  - Integration with the southbound API (OpenFlow)

# Example

*tnc21*

```
84 def test_015_create_evc_inter_switch(self):
85     time.sleep(10)
86     payload = {
87         "name": "my evc1",
88         "enabled": True,
89         "dynamic_backup_path": True,
90         "uni_a": {
91             "interface_id": "00:00:00:00:00:00:00:01:1",
92             "tag": {
93                 "tag_type": 1,
94                 "value": 15
95             }
96         },
97         "uni_z": {
98             "interface_id": "00:00:00:00:00:00:00:02:1",
99             "tag": {
100                 "tag_type": 1,
101                 "value": 15
102             }
103         }
104     }
105     api_url = KYTOS_API + '/mef_eline/v2/evc/'
106     response = requests.post(api_url, data=json.dumps(payload),
107                             assert response.status_code == 201
108     data = response.json()
109     assert 'circuit_id' in data
110     time.sleep(20)
111
```

User request

```
112 # Each switch must have 3 flows: 01 for LLDP + 02 for the EVC (ingress + egress)
113 s1, s2 = self.net.net.get('s1', 's2')
114 flows_s1 = s1.dpctl('dump-flows')
115 print(flows_s1)
116 flows_s2 = s2.dpctl('dump-flows')
117 print(flows_s2)
118 assert len(flows_s1.split('\r\n ')) == 3
119 assert len(flows_s2.split('\r\n ')) == 3
120
121 # make sure it should be dl_vlan instead of vlan_vid
122 assert 'dl_vlan=15' in flows_s1
123 assert 'dl_vlan=15' in flows_s2
124
125 # Make the final and most important test: connectivity
126 # 1. create the vlans and setup the ip addresses
127 # 2. try to ping each other
128 h11, h2 = self.net.net.get('h11', 'h2')
129 h11.cmd('ip link add link %s name vlan15 type vlan id 15' % (h11.intfNames()[0]))
130 h11.cmd('ip link set up vlan15')
131 h11.cmd('ip addr add 15.0.0.11/24 dev vlan15')
132 h2.cmd('ip link add link %s name vlan15 type vlan id 15' % (h2.intfNames()[0]))
133 h2.cmd('ip link set up vlan15')
134 h2.cmd('ip addr add 15.0.0.2/24 dev vlan15')
135 result = h11.cmd('ping -c1 15.0.0.2')
136 assert ', 0% packet loss,' in result
```

Control plane validation

Data plane validation

# End-to-end tests

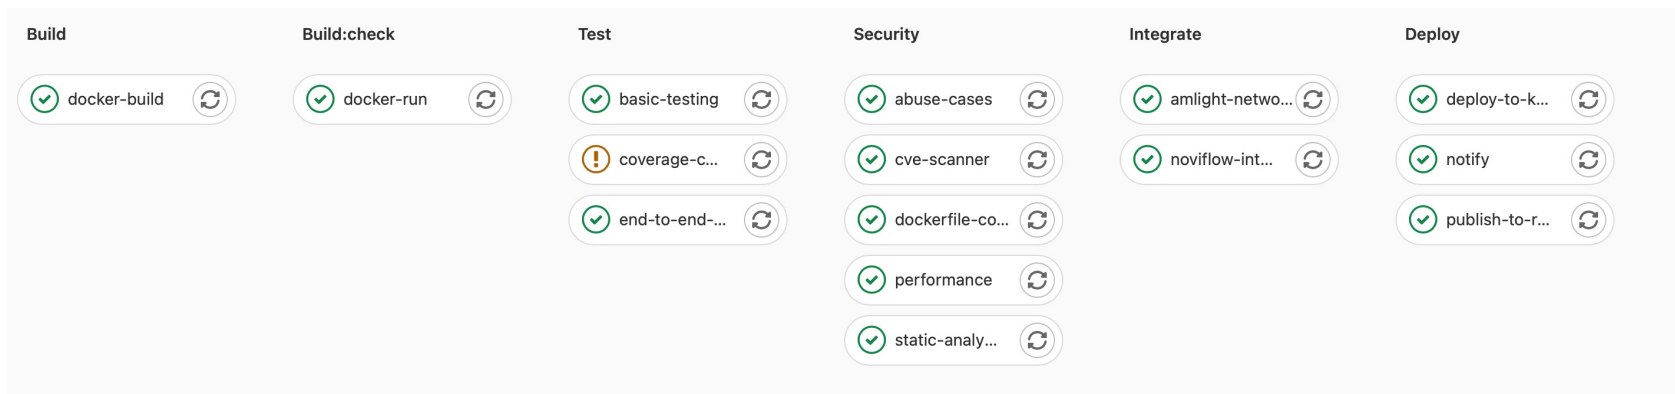

*tnc21*

- Code repository: <https://github.com/amlight/kytos-end-to-end-tests>
  - 128 tests being executed (project start in Jun/2020)
  - Basic tests, concurrent requests, heavy usage conditions, fail scenarios, tricky requests
  - Testing all the main Kytos-ng components and additional napps
  - Using different network topologies
  - Runs in a daily basis (or on demand) and over the master branches (or for specific pull requests)
  - Three people involved: Network Engineer, Software Engineer and Quality Assurance Tester
- Current results:
  - 109 passed, 0 failed, 16 xfailed, 3 xpassed
  - Duration: 96 min

## Other results (side effects)

*tnc21*

- Use case 1: Information leakage due to sensitive information being published in the Git repository together with the code
- Use case 2: Change in the L2VPN service would deliver the packets to the user with wrong headers (i.e., VLAN ether-type as a service provider VLAN instead of the original one)
- Use case 3: A firmware release with a bug that eventually delivers corrupted telemetry reports for certain traffic profiles

## Ongoing actions

The logo for tnc21, featuring the text 'tnc21' in a white, italicized, sans-serif font, positioned on the right side of a dark blue header bar. The background of the header bar has a subtle pattern of vertical bars in various colors (purple, blue, green, yellow) on the right side.

- Adding new tests and scenarios (identifying use cases, abuse cases, tricky requests, etc)
- Validate how the SDN Orchestrator deals with failures in the infrastructure or southbound API
  - Example 1: Storage backend failing to persist information
  - Example 2: OpenFlow port which does not support output action
  - Example 3: switch reconnecting
- Improve the testing process performance, to enable a per pull-request pipeline execution

# Outcomes

The logo for tnc21, featuring the text 'tnc21' in a white, italicized, sans-serif font, positioned on the right side of a dark blue header bar. The background of the header bar has a subtle pattern of vertical bars in various colors (purple, blue, green, yellow) on the right side.

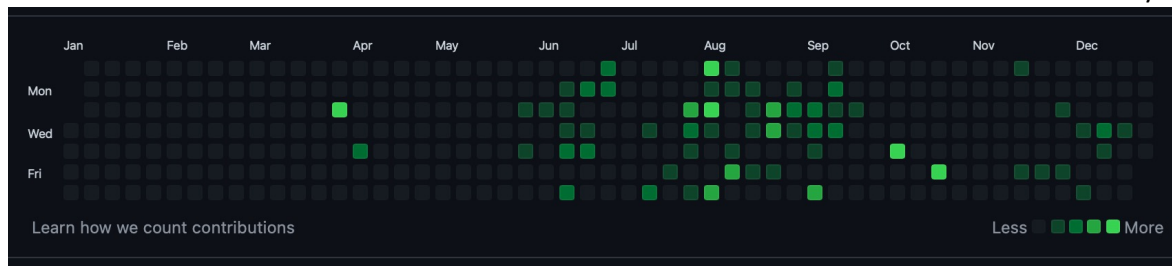

- Main outcome: more reliable, secure and robust SDN Orchestrator, with enhanced testing coverage and quality
- Automation is usually much more difficult and time consuming than manual processes, advantages will be seen in a long-term run
- Always evolving project, applying the best practices from DevOps culture and Software Engineering

# Lessons Learned

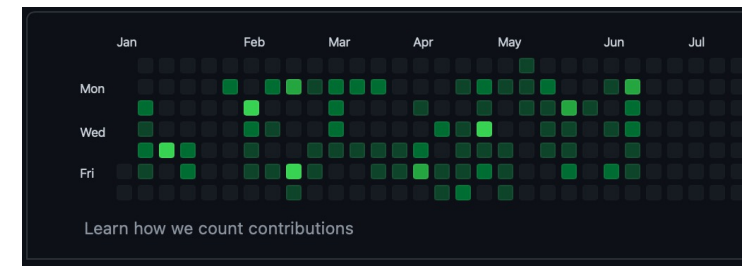

*tnc21*

- It's been a learning journey for a Network Engineer directly participate in the software development lifecycle: creating tests, interacting with developers, creating blueprints, reviewing PRs, submitting PRs
- The interaction with developers always give many insights and they are very productive
- I've learned many concepts, tools and frameworks through out the process: Ansible, pytest, pylint, infrastructure as code, gitlab-ci, docker, gNMI/ gNOI, etc.
  - I'm thankful for many books, blogs, authors for all I learned (special thanks to <https://gomex.me>)
